

Integrate c:node as your knowledge layer

Embed the evidenced c:node graph into your product via the Contract-API and MCP
— every answer with its source.

What it's about

The c:node graph connects law, registers and markets into an evidenced knowledge network. Instead of letting a language model guess, c:node delivers answers you can trace back to their source — with a reference, or a clear “no evidence”.

Who it's for

For SaaS vendors and IT consultancies that want to give their product an evidenced, EU-sovereign knowledge layer — without building a graph themselves.

How it works

- ✓ **Contract-API (REST)** evidenced answers, dossiers and legal/benefit lookups straight from your backend.
- ✓ **MCP server** c:node as a tool in Claude, Copilot and your own agents.
- ✓ **Profile as plan** you pay per evidenced answer, not per seat.

What you get

- ✓ Technical onboarding and example integrations
- ✓ Fair, usage-based terms
- ✓ EU hosting or on-prem, depending on your customers

Evidenced. EU-sovereign. Every answer with its source.

Built for GDPR: EU cloud Frankfurt or on-prem up to air-gapped.
